

# HARTNER

Precision Cutting Tools

## THREAD MILLING CUTTERS

THE COMPLETE PROGRAMME

+ NEW: Helical drill thread milling cutter & micro thread milling cutters from M1.4

# ISO code

<b>P</b>	Steel, high-alloyed steel
<b>M</b>	Stainless steel
<b>K</b>	Grey cast iron, spher. graphite iron/malleable cast iron
<b>N</b>	Aluminium and other non-ferrous metals
<b>S</b>	Special, super and titanium alloys
<b>H</b>	Hardened steel and chilled cast iron

# Pictograms

Tool material

**VHM**

Solid carbide

Surface

TiCN TiAlN TiSiN

Thread type

Through holes/blind holes

Internal cooling

with IC without IC

**GFR – THREAD MILLING CUTTERS** without chamfer

P. 7

Simple option for thread milling one thread size  
Thread types: M, MF, UNF, UNC, NPT, G

**GFR S – THREAD MILLING CUTTERS** with 45° chamfer

P. 15

High productivity thanks to countersinking and thread milling with one tool, high running smoothness and low lateral forces.  
Thread types: M, MF, G

**GFR U – UNIVERSAL THREAD MILLING CUTTER** with recessed neck

P. 19

For different thread sizes with equal pitch, e.g. thread M30x1,5, milling cutter Ø 12xM1,5, Ø 16xM1,5 or Ø 20xM1,5  
Thread types: internal threads: M, MF | internal and external threads: G, NPT

**MGFR – MICRO THREAD MILLING CUTTERS**

P. 23

MGFR 3  
Thread size and pitch are predetermined

(3xD) M1,6–M16, G1/8" - G2", UNC, UNF, UNJC, UNJF, MJ, VHM TiCN

MGFR 1  
Universal production of nominal thread diameters up to maximum pitch

(3xD) M1,4–M10, Solid carbide TiCN

MGFRH 3  
Machining of hardened steels from 45 HRC – 65 HRC

(2xD–3xD) M2–M12, Solid carbide TiAlN

**HELICAL DRILL THREAD MILLING CUTTER**

P. 28

Helical drill thread milling into solid material up to 66 HRC, combined machining of core hole and thread production, (2.5xD) M2–M16, Solid carbide TiSiN

**OUR SERVICE**

P. 30

Free supply of CNC programmes

# WHAT ARE THE ADVANTAGES OF THREAD MILLING COMPARED WITH TAPPING AND THREAD FORMING?

- ▼ different materials can be machined with one tool (aluminium, steel, cast iron, stainless steel, titanium, Inconel, max. HRC 65 and many more)
- ▼ Various diameters and tolerances are possible with one tool (e.g. 6H+0.1, 7G, EG and many more)
- ▼ one tool for through and blind holes as well as right- and left-hand threads
- ▼ thread depth possible up to the base of the hole (0.5xP)
- ▼ no axial cross-cutting
- ▼ saving tool locations (with type GFR S)
- ▼ problem-free chips because short milling chips are produced
- ▼ reduced tooling costs with the same pitch and large threads (type GFR U)
- ▼ short cycle times thanks to high cutting speed and feed rate
- ▼ high process reliability even in the event of tool breakage as the thread milling cutter can be completely removed from the workpiece and the machine
- ▼ high economic efficiency thanks to Hartner's re-grind and re-coating service

# MGFR – MICRO THREAD MILLING CUTTERS

## Micro thread milling cutters

Solid carbide micro thread milling cutters have been specially developed for the production of threads in small holes:

- excellent characteristics in higher-strength materials (e.g. titanium alloys, stainless steels, ...)
- blind holes and through holes up to 3xD
- minimum cutting force
- very good thread quality
- short machining times
- also suitable for softer materials (e.g. aluminium or plastics)

Free CNC programming on request!

# HELICAL DRILL THREAD MILLING INTO SOLID MATERIAL UP TO 66 HRC MGFRH 3-Z

- ▼ process reliability and true to gauge threads guaranteed
- ▼ excellent machining results in dry and wet machining
- ▼ core holes and threads in one step: significantly shorter cycle and setting time
- ▼ universally applicable in unhardened and hardened materials up to 66 HRC

# OUR SERVICE

## Free creation of CNC programmes

To make the machining with our thread milling cutters as easy as possible, we set up the suitable CNC programme for your individual application and machine control.

For the programme creation we only require:

- thread type and size
- material to be machined
- desired Hartner article no.
- type of machine control

We supply you with the programming data, which can be automatically recognised and read. The programming data is available for Sinumerik, Heidenhain, Fanuc, Mazatrol and Hurco.

Furthermore, with each programme, you will receive a CNC data sheet with all parameters, see page on the right.

Software to download for free at [www.hartner.de](http://www.hartner.de)

# TECHNICAL SECTION

### The Hartner thread milling cutter types

#### GFR – Thread milling cutters without chamfer

- simple and cost-efficient tool for the milling of internal threads
- 2-3 thread sizes with the same pitch can be produced over the specified nominal dimension
- application in materials  $\leq 1000 \text{ N/mm}^2$
- available with or without internal cooling

**Thread types: M, MF, UNC, UNF, G, NPT**

#### GFR S – Thread milling cutters with 45° chamfer

- countersinking and thread milling with only one tool
- very smooth running and low lateral forces
- designed for the application of difficult-to-machine materials also available w/o countersinking step
- 2-3 thread sizes with the same pitch can be produced over the specified nominal dimension
- only available with internal cooling

**Thread types: M, MF, G**

#### GFR U – Universal thread milling cutters with recessed neck

- universal application possibilities
- for various thread sizes with the same pitch, e.g. thread M30x1.5 with milling cutter  $\varnothing 12 \times M1.5$ ,  $\varnothing 16 \times M1.5$  or  $\varnothing 20 \times M1.5$
- only available with internal cooling

**Thread types: Internal thread: M, MF  
Internal- and external thread: G, NPT**

#### MGFR 3 – Micro thread milling cutters

- thread size and pitch are predetermined
- excellent characteristics with high-tensile materials such as titanium, stainless steel etc.
- suitable for the machining of hardened steel 45HRC–65HRC
- threads up to 3xD
- only available without internal cooling; with internal cooling on request

**Thread types: M, MF, UNC, UNF**

#### MGFRH 3-Z – Helical drill thread milling cutter

- helical drill thread milling into solid material up to 66 HRC
- combined machining of core hole and thread production

**Gewindearten: M**

#### MGFR 1 – Micro thread milling cutters

- universal production of nominal thread diameters up to a maximum pitch
- only available without internal cooling

**Thread types: M, MF**

### Difference between taps/fluteless taps and thread milling cutters

**Taps/Fluteless taps**

The red lines show the pitch angle of the thread that is ground into the tool. This means the pitch is cut into the workpiece by the tool.

**Thread milling cutters**

The red lines show that the tool does not possess a pitch angle. The pitch is produced by the Z-axis of a CNC machine.

**Creation of the thread with thread milling**

Thread profile without axial feed (Z-axis) of the machine. A groove profile is created without pitch. A functioning thread is not created.

Through the additional programming of the Z-axis the necessary pitch is produced.

**Note**

Due to diagonal milling in the pitch angle (Z-axis) the thread profile of the tool is transferred onto the component distorted. The more the milling cutter diameter (80 % of nom. Ø) approaches the nominal thread diameter and the higher the thread pitch the more pronounced the profile distortion is.

### Distinction between two milling processes

**Reverse rotation milling clockwise, with G02**

Reverse rotation milling is preferentially applied for the machining of harder materials or to remedy taper threads.

**Synchronous milling anticlockwise, with G03**

Synchronous milling is applied with thread depths smaller than  $1.5 \times D$ . Advantage: A better surface finish is achieved.

**Thread production with one tool  
Right-hand thread reverse rotation milling**

Tool rotates clockwise from top to bottom.

**Thread production with one tool  
Left-hand thread reverse rotation milling**

Tool rotates clockwise from bottom to top.

**Thread production with one tool  
Right-hand thread synchronous milling**

Tool rotates clockwise from bottom to top.

**Thread production with one tool  
Left-hand thread synchronous milling**

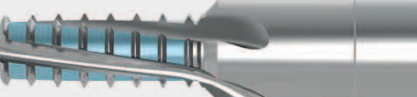

Tool rotates clockwise from top to bottom.

### Thread milling cutter modifications

Illustration	Modification	Effect
	Cooling slots on shank	Targeted cooling, without weakening the tool cross-section in the cutting edge area
	Radial coolant exits	Targeted cooling with through hole threads
	Threads removed	Reduced cutting forces but longer machining time because two cycles are required
	De-burring cutting edge	Removing the incomplete threads at the thread run-in without additional operating step
	First thread profile lengthened at the face	Chamfering a tapping size hole
	Grinding collar	Enables axial distribution of cuts – useful for deep threads

### Taping size holes for thread milling cutters

### Practical application of thread milling cutters

#### 1. Tool clamping

good concentricity is important, therefore clamping as short and rigid as possible.

#### 2. Enter tool data in machine memory

- a. Tool length from the front face, take drill/thread milling cutters (DTMC) from point.
- b. Measure tool radius with tool pre-setting equipment. General rule:  
measured radius – 0.022 x pitch provides the input value in machine memory.

#### 3. Input of CNC program in control

- (preferably integrated as sub-program at corresponding positions)
- a. Call-up of a self-controlling cycle (procedures should be known)
  - b. Integration of data file from our threadmill-software (DIN or Haidenhain)

#### 4. Trial run over workpiece

- a. Tool length dimension in memory extending by an approximate value dependent on contact length (e.g. 30 mm) or offset zero point.
- b. Run program in single set, visual check of travel path.
- c. Allow program to run in automatic mode.

#### Attention

With controls where it is not definitely clear what milling path is assigned it must be clarified if the feed is positioned on the external path  $v_f$  or at the centre path  $v_m$ . As a rule we specify the milling centre point path  $v_m$ .

#### 5. Application in workpiece

Re-set the tool extension or the zero point. Then allow the program to run in the workpiece the feed regulation must be 100% selected. Should the thread not be true to gauge, the tool radius requires correction in the tool memory:

Example:

- Thread too tight: Radius correction – input
- Thread too large: Radius correction + input

### Thread milling programming

#### Program specifications

#### Thread milling functions

<b>G00</b>	Rapid movement	<b>G90</b>	Absolute dimension
<b>G01</b>	Feed	<b>G91</b>	Incremental dimension
<b>G02</b>	Circular interpolation (clockwise)	<b>M03</b>	Spindle on (clockwise rotation)
<b>G03</b>	Circular interpolation (anti-clockwise)	<b>M05</b>	Spindle stop
<b>G17</b>	Layer selection x-y axis	<b>M08</b>	Coolant on
<b>G18</b>	Layer selection z-x axis	<b>X</b>	Axis
<b>G19</b>	Layer selection y-z axis	<b>Y</b>	Axis
<b>G40</b>	Cancel tool correction	<b>Z</b>	Axis
<b>G41</b>	Tool path correction (left of contour)	<b>I</b>	Thread pitch parallel to X-axis
<b>G42</b>	Tool path correction (right of contour)	<b>J</b>	Thread pitch parallel to Y-axis
<b>G43</b>	Tool length compensation (call-up)	<b>S</b>	Spindle speed
<b>G49</b>	Tool length compensation (deselect)	<b>F</b>	Feed
<b>G54</b>	Zero offset		

#### CNC internal thread milling

1. Moving to start position
2. Moving to thread depth in bore
3. 180° descending loop to contour
4. 360° full circular movement of thread milling cutter
5. 180° exit loop to centre of bore
6. Rapid movement from bore to start position

#### Formula of calculation

$$v_c = \frac{d \cdot \pi \cdot n}{1000}$$

$$n = \frac{v_c \cdot 1000}{d \cdot \pi}$$

$$v_f = n \cdot z \cdot f_z$$

$$v_m = \frac{v_f \cdot (D - d)}{D}$$

$$v_b = n \cdot f_b$$

- $v_c$  = Cutting speed
- $v_f$  = Contour feed
- $v_m$  = Centre point path feed
- $n$  = Revolutions
- $z$  = Number of teeth
- $f_z$  = Feed per tooth
- $f_b$  = Feed per drill per revolution\*
- $v_b$  = Drill feed rate\*
- $D$  =  $\varnothing$  nom. of thread [mm]
- $d$  = Milling cutter nom.  $\varnothing$  [mm]
- \* for drill/thread milling

### Thread milling programming

Programming process for micro thread milling (right-hand thread in reverse rotation)

#### Possibilities to reduce radial forces

To reduce radial forces cut distribution can be undertaken:

##### Advantage

- for larger thread depths
- counteracts taper threads
- for unstable clamping conditions

##### Disadvantage

- increased tool wear
- longer production time

#### Axial distribution of cut

#### Radial distribution of cut

### Application examples

<b>Component</b>	Crankcase AlSi7
<b>Machining</b>	Boring with 180° hole base, chamfering and thread milling a pre-cast hole, through hole M20x1.5, thread depth = 20 mm
<b>Tool</b>	Solid carbide drill thread milling cutters DTMZ M20x1.5 with IC, 180° drill cutting edge
<b>Cutting rates</b>	$v_c = 250$ m/min, $f_b = 0.30$ , $f_z = 0.10$ mm
<b>Tool life</b>	60.000 threads

<b>Component</b>	Pump housing AlSi12
<b>Machining</b>	Drilling, chamfering, facing and thread milling, blind hole M10x1, thread depth = 15 mm
<b>Tool</b>	Solid carbide drill thread milling cutters DTMZ M10x1 with IC and spot facer
<b>Cutting rates</b>	$v_c = 280$ m/min, $f_b = 0.07$ , $f_z = 0.05$ mm
<b>Tool life</b>	24.000 threads

### Selecting the correct clamping chuck

Correct tool clamping also plays an essential role with thread milling. Thread milling cutters should as a rule be clamped as short as possible. A compact and mechanical clamping force is preferable. The error in concentricity should not exceed 0.02 millimetres.

#### Power chucks

A power chuck excels thanks to extremely accurate concentricity. The high clamping forces and optimal smooth running are a perfect prerequisite for the production of threads in all materials including a high pitch.

max. permissible error in concentricity: 0.003 mm

#### Side lock holders

A side lock holder for HB and HE shanks is a robust, cost-efficient clamping chuck with a maximum clamping force. The clamping surface prevents the tool twisting or being pulled out during machining. Therefore, side lock holders are suitable for the production in all materials including a high pitch.

max. permissible error in concentricity: 0.002 mm

#### Shrink fit chucks

A shrink fit chuck creates a rigid connection with the shrink fitted tool. Incorrect shrink fitting or older shrink fit chucks can result in the pulling out of the tool. Tool breakage and possible loss of the component would be the consequence. Therefore, the shrink fit chuck is only suitable for a thread pitch  $< P = 1.5$  mm.

max. permissible error in concentricity: 0.005 mm

#### Hydraulic chucks

A hydraulic chuck, similar to the shrink fit chuck, has only limited suitability for thread milling. Especially with high radial forces this clamping chuck reaches its limits. Therefore, the hydraulic chuck is recommended for softer materials such as aluminium and a thread pitch  $< P = 1.5$  mm.

max. permissible error in concentricity: 0.005 mm

#### Collet holders

Collet chucks are very well suited for micro-thread milling because only axial stresses are created. The low clamping forces only permit the milling of softer materials. Consequently, collet holders are not suitable for conventional thread milling.

max. permissible error in concentricity: 0.01 mm

### Maximum economic efficiency thanks to reconditioning to original quality

Even the most wear-resistant tool will wear sometime under heavy stresses. Thanks to the reconditioning to original geometries and coatings Hartner manages to reproduce the original performance of the tool.

#### Re-grinding

In our service centres, tools are re-ground on the front rake face according to the degree of wear. According to width of wear marks the re-grind service is possible two or three times (from milling part diameter  $d_1 > 5.0$  mm).

In order to re-define the milling portion diameter  $d_1$ , the number of regrinds is indicated by a notch on the end of the shank. This means every notch is assigned to a diameter and re-marked.

#### Re-coating

If a thread mill was enhanced with a coating, the tool is re-coated following the re-grind. This way, not only the wear and corrosion-protection as well as the glide characteristics are re-produced but also the tool life prolonged.

# APPLICATION RECOMMENDATIONS

## Thread milling cutters and micro thread milling cutters

		55-66 HRC	PM30		30

Please note:

The cutting values specified in the respective columns are guide values, they have to be adapted according to application conditions (material, lubrication, tool clamping, machine etc.)

Depending on the machining task the optimal cutting values can differ from those in the table by up to ±30 %!
